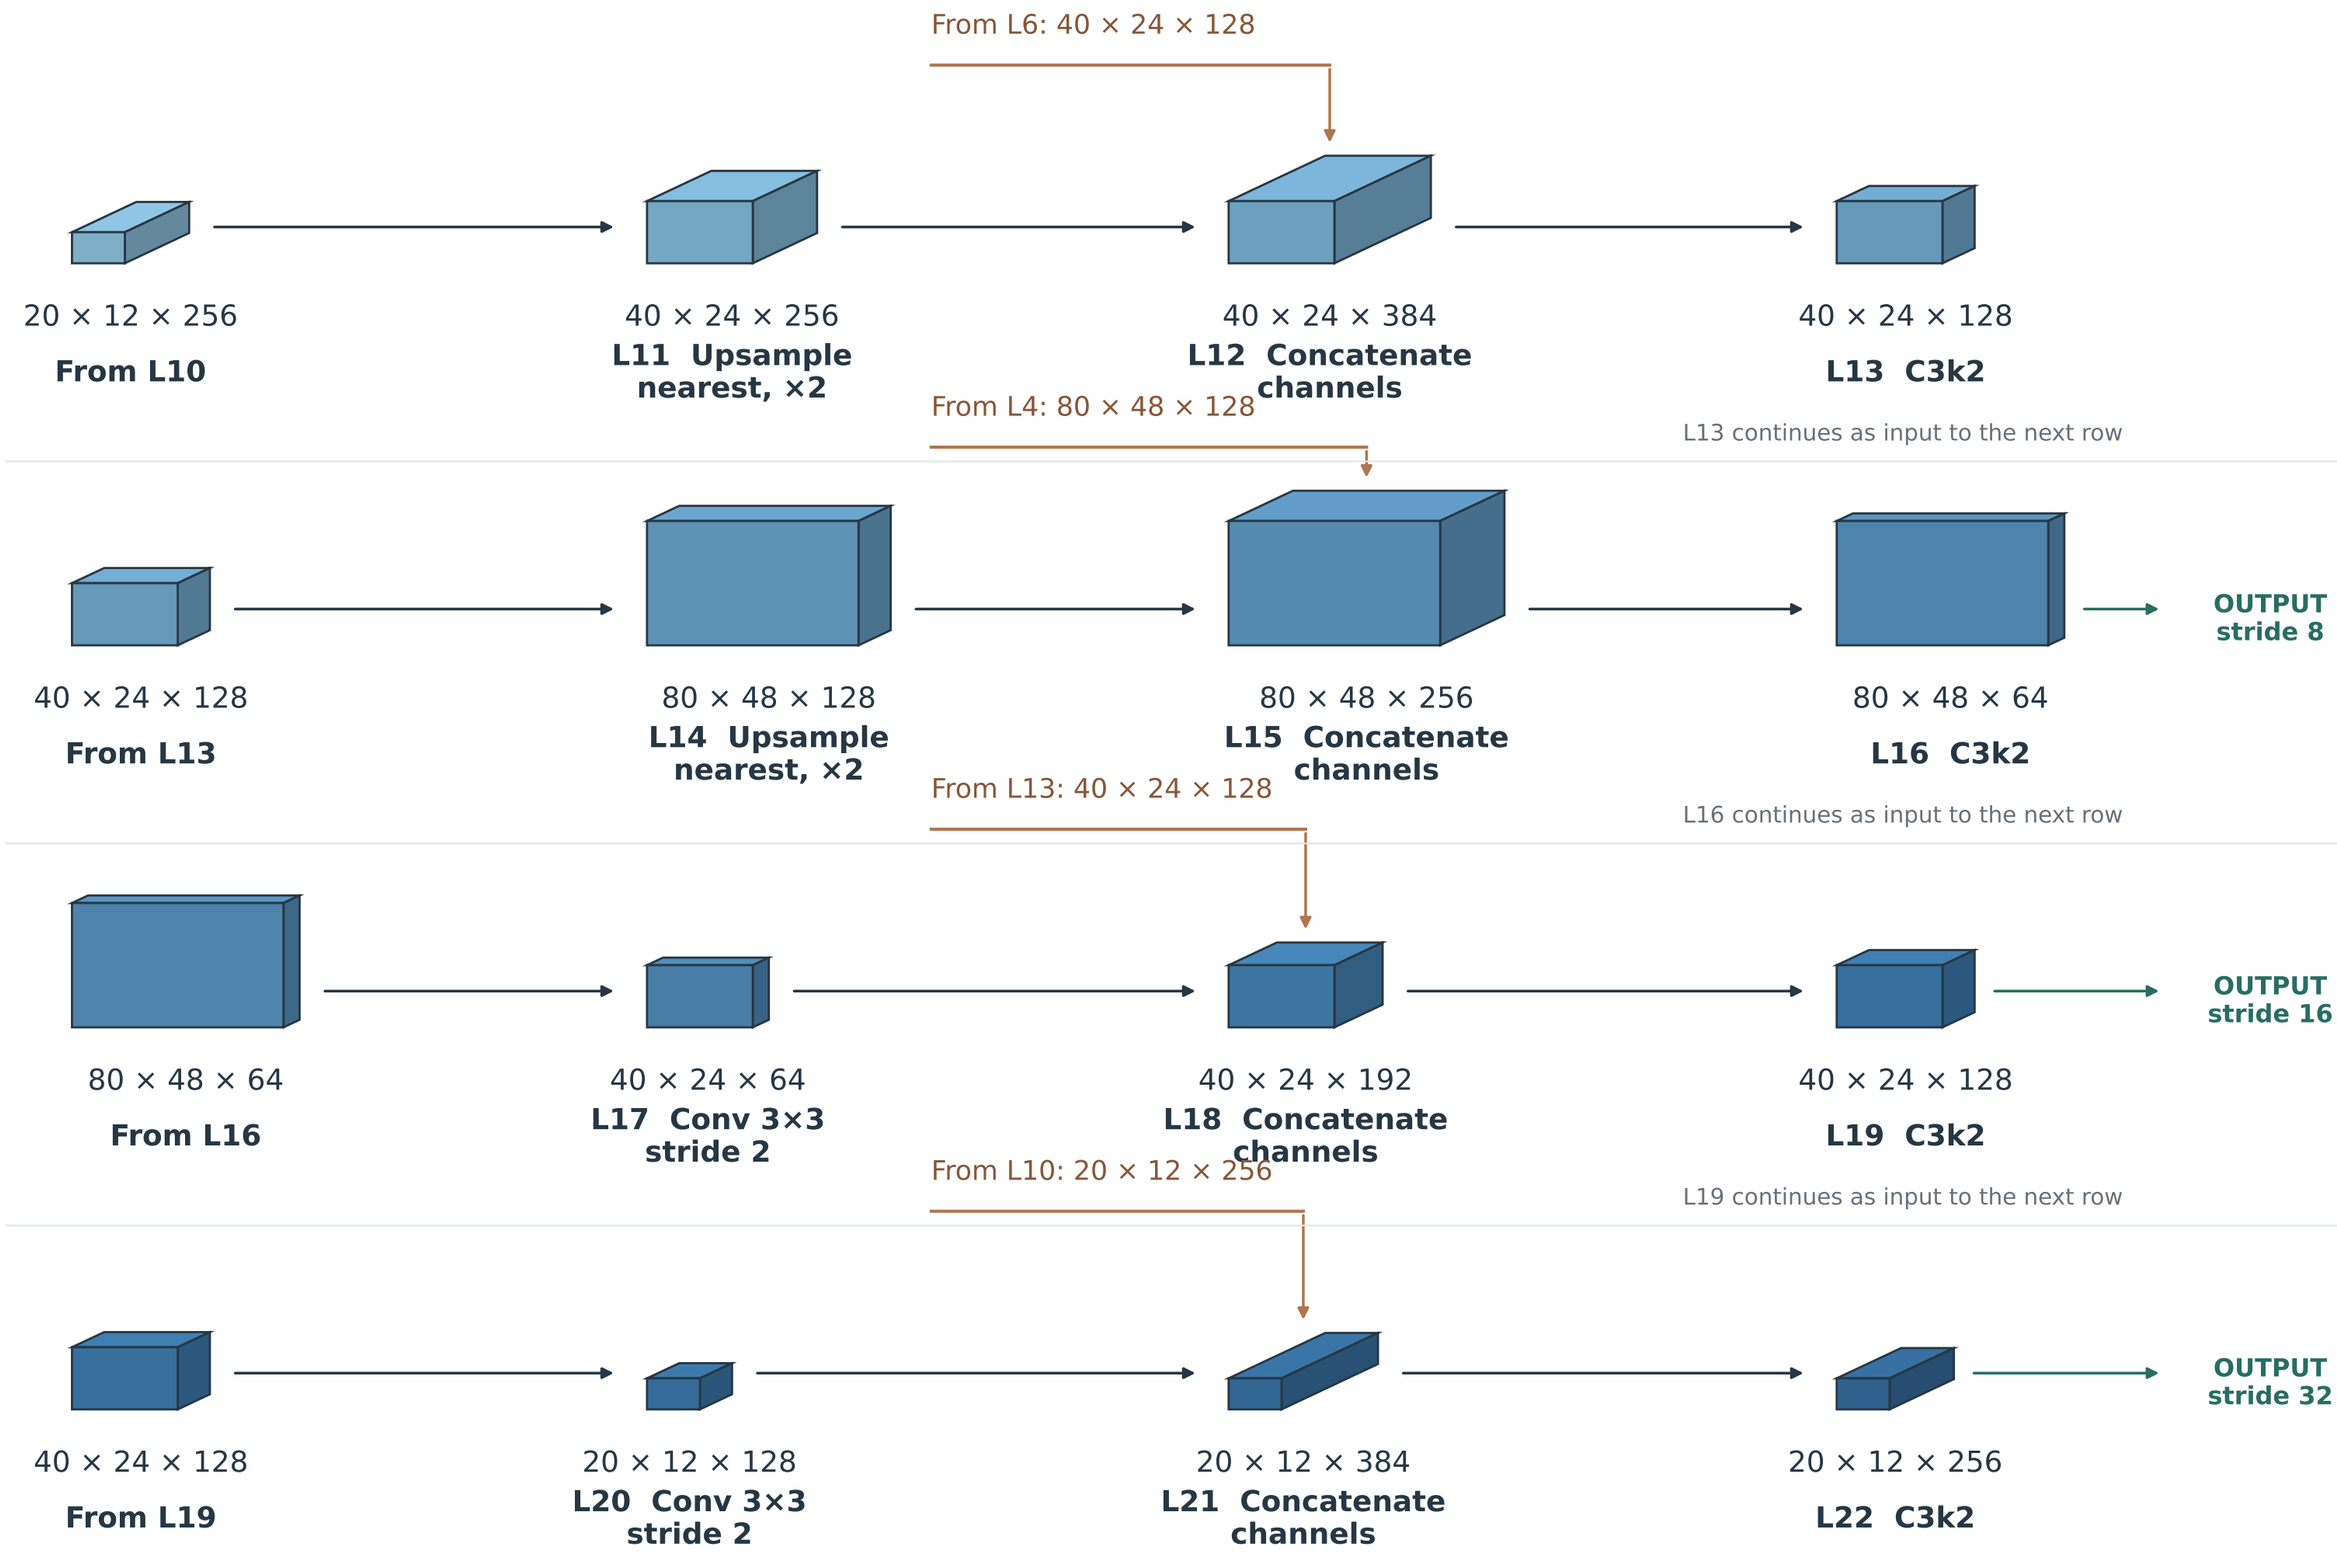
YOLO11n neck: scale changes and feature connections

Every top-level block is shown. Feature dimensions come from the actual 640 × 384 forward pass.

Tensor faces use one common spatial scale within this panel; depth is proportional to channels.



Outputs L17, L20, and L23 enter temporal processing separately. The original detector sends them directly to its detection head.

All neck weights and BatchNorm statistics are frozen. This panel enlarges spatial faces 4× relative to the backbone panel.
